

Initialize Launch Mechanism–Casual Format

Main Success Scenario

1. With the System running, the Flight Director enter the Mission Parameters File (See *Use Case 1 Initialize Launch*)
2. System opens the Mission Parameters File
3. System finds the Launch Platform Data
4. System finds the Launch Mechanism Data in the Launch Platform Data
5. System stores the Launch Mechanism Data
6. System finds the Rocket Data
7. System stores the needed Rocket Data
8. System returns the Initialized Launch Mechanism Data to the Flight Director

Alternative Scenarios

- 2a. If the System cannot open the Mission Parameters File, then the System alerts the Flight Director of the Error.
- 3a. If the System cannot access the Launch Platform Data, then the System alerts the Flight Director of the Error.
- 4a. If the System cannot access the Launch Mechanism Data, then the System alerts the Flight Director of the Error.
- 6a.,7a. If there is no Rocket Data available, then the System continues without storage, alerting the Flight Director

Notes/Constraints

- 6b.,7b. Since prior Rocket Initializations is a definite possibility at this point, the more likely scenario is the System accesses the initialized Rocket Data
