

Initialize Launch Platform–Casual Format

Main Success Scenario

1. With the System running, the Flight Director enters the Mission Parameters File (See *Use Case 1 Initialize Launch*)
2. System opens the Mission Parameters File
3. System finds the Launch Mechanism (Platform) Data
4. System stores the Launch Mechanism (Platform) Data
5. For each hold on the Launch Mechanism (Platform), System initializes the hold (See *Use Case 1.3 Initialize Launch Mechanism*)
6. System finds the Rocket Data
7. System stores the needed Rocket Data
8. System returns the Initialized launch Mechanism Data to the Flight Director
9. System returns the Initialized Rocket Data

Alternative Scenarios

- 2a. If the System cannot open the Mission Parameters File, then the System alerts the Flight Director of the error.
- 3a. If the System cannot access the Launch Mechanism (Platform) Data, then the System alerts the Flight Director of the error.
- 6a. If the System cannot access the Rocket Data, then the System alerts the Flight Director of the error.

Notes/Constraints

- 6a.,7a Since the Rocket Initialization is a definite possibility at this point, the more likely scenario is the System accesses the Initialized Rocket Data
